Core Plus Fixed Income Review: Second Quarter 2010

- As spreads widened in May and June, we increased our allocation to the corporate sector. The composite is overweight in the credit sector with holdings focused on bank, insurance and utility issues that we expect to outperform.
- Our weighting in Treasury securities declined during the quarter to make room in the composite for the additions in the corporate sector.
- We maintain a "barbell" positioning to take advantage of the historically steep yield curve. If the yield curve flattens further, as we anticipate it might, the composite should outperform.
- The composite is defensively positioned in MBS and, as a result, we are underweight the sector. Our focus is on 10-year amortization, low coupon, agency mortgage securities. We believe these shorter maturity securities have attractive spreads and a lower risk profile relative to other agency securities in the MBS sector.
- We maintain our overweight position in the ABS sector. The holdings in this sector are focused on auto finance, which is backed by solid collateral.

Core Fixed Income Review: Second Quarter 2010

- The composite remains overweight in Treasury securities as we maintain a lower risk profile and also as a result of our “barbell” positioning to take advantage of the historically steep yield curve. If the yield curve flattens further, as we anticipate it might, the composite should outperform.
- After initially reducing some positions in April, we increased our allocation to the corporate sector as spreads widened in May and June. The composite is focused on bank, insurance, and utility issues that we expect to outperform.
- The composite is defensively positioned in MBS and, as a result, we are underweight the sector. Our focus is on 10-year amortization, low coupon, agency mortgage securities. We believe these shorter maturity securities have attractive spreads and a lower risk profile relative to other agency securities in the MBS sector.
- We maintain our overweight position in the ABS sector. The holdings in this sector are focused on auto finance, which is backed by solid collateral.

Intermediate Fixed Income Review: Second Quarter 2010

- Our Treasury position remains elevated as we maintain a lower risk profile and also as a result of our ‘barbell’ positioning to take advantage of the historically steep yield curve. If the yield curve flattens further, as we expect it to, the composite should outperform.
- The composite’s MBS holdings are targeted in CMBS and well call-protected MBS in unique areas of the market. For example, MBS holdings include multi-family agency securities with superior prepayment profiles, as well as 10-year amortization agency pass-throughs.
- We remain overweight in the ABS sector, where we continue to find value, particularly in the auto finance portion of this sector.
- We maintain a near index weight in the corporate sector, but our corporate holdings remain focused on bank, insurance, and industrial issues that we expect to outperform.

Long Duration Fixed Income Review: Second Quarter 2010

- The composite remains positioned with a 'barbell' in regard to yield curve exposure as we expect the historically steep yield curve to flatten. We find Treasury STRIPs as attractive long duration instruments from a valuation perspective and expect them to outperform coupon-bearing Treasuries once the flattening ensues.
- As spreads widened in May and June, we added to positions in the corporate sector bringing the composite to an overweight position relative to the index. We continue to find value in certain parts of the investment grade corporate market, particularly in the metals and energy sectors.
- We are underweight the government related sector as we reduced our overweight in the Build America Bond (BAB) issues during the quarter. Spreads in BAB issues did not widen as much as the corporate sector, leading to more attractive opportunities in corporates.

■ Long Duration Composite Characteristics: 6/30/10

Low Duration Fixed Income Review: Second Quarter 2010

- Our Treasury position remains elevated as we maintain a lower risk profile and also as a result of our 'barbell' positioning to take advantage of the historically steep yield curve. If the yield curve flattens further, as we expect it to, the composite should outperform.
- The composite's MBS holdings are targeted in well call-protected securities in unique areas of the market. For example, MBS holdings include multi-family agency securities with superior prepayment profiles, as well as seasoned 10-year amortization agency pass-throughs.
- We remain modestly overweight in the ABS sector, where we continue to find value in the auto finance and credit card portions of this sector.
- The composite is overweight in the credit sector with holdings focused on bank and insurance issues that we expect to outperform.

REAMS ASSET MANAGEMENT COMPANY

Real Return Fixed Income Review: Second Quarter 2010

- The portfolio maintains a short duration position, which will help protect the portfolio if real yields move higher.
- The portfolio's position in nominal Treasurys is focused in the short end of the yield curve as real yields are currently negative in this portion of the curve.
- The TIPS holdings in the portfolio have a lower index ratio relative to the benchmark, providing better protection against a sharp deflationary move.
- We continue to hold part of the portfolio outside of the TIPS and Treasury sectors, with modest positions in corporate, ABS, and MBS sectors.

Absolute Return Fixed Income Product

■ The Absolute Return Product seeks to maximize total returns by systematically pursuing relative value opportunities throughout all sectors of the fixed income market. The firm's disciplined investment philosophy and process are used to identify and evaluate relative value opportunities and the "best ideas" are selected for use in Absolute Return portfolios. Although the product has historically focused on the high yield credit sector where attractive relative value opportunities have been plentiful, the Absolute Return strategy seeks opportunities in all sectors of the fixed income market including investment grade and high yield credit, governments, agencies, mortgage-backed, asset-backed, emerging market, and non-dollar securities. Unlike a hedge fund, the Absolute Return Product will not borrow money nor will it purchase securities on margin; however, derivative instruments such as futures, options and credit default swaps may be utilized to gain exposure and manage risk. Given the relative value and "best ideas" strategy, the Absolute Return Product is not managed against a benchmark. Average portfolio duration is generally between 0 to 6 years. The targeted annual return is LIBOR plus 200 basis points per annum (with lower volatility than the broad fixed income market) over a full market cycle.

■ Investment Philosophy

Volatility is a key driver of performance in the fixed income market. It is usually higher than commonly perceived and often mispriced in the marketplace. This core belief leads us to:

- Focus on long-term value and "total return"
- Employ macro and bottom-up strategies to uncover unique opportunities
- React opportunistically to valuation discrepancies and volatility in the bond market

■ Investment Process

Step One Determine whether the bond market is cheap or expensive by comparing the current real interest rate to historical rates

Step Two Focus on sectors offering relative value and select securities offering the highest risk-adjusted return

Step Three Continually measure and control exposure to security- and portfolio-level risks
